

TITANPred converts one COAD feature vector into a multi-endpoint molecular profile

Examples were selected for maximal continuous-profile separation; this internal TCGA demonstration is not external validation.

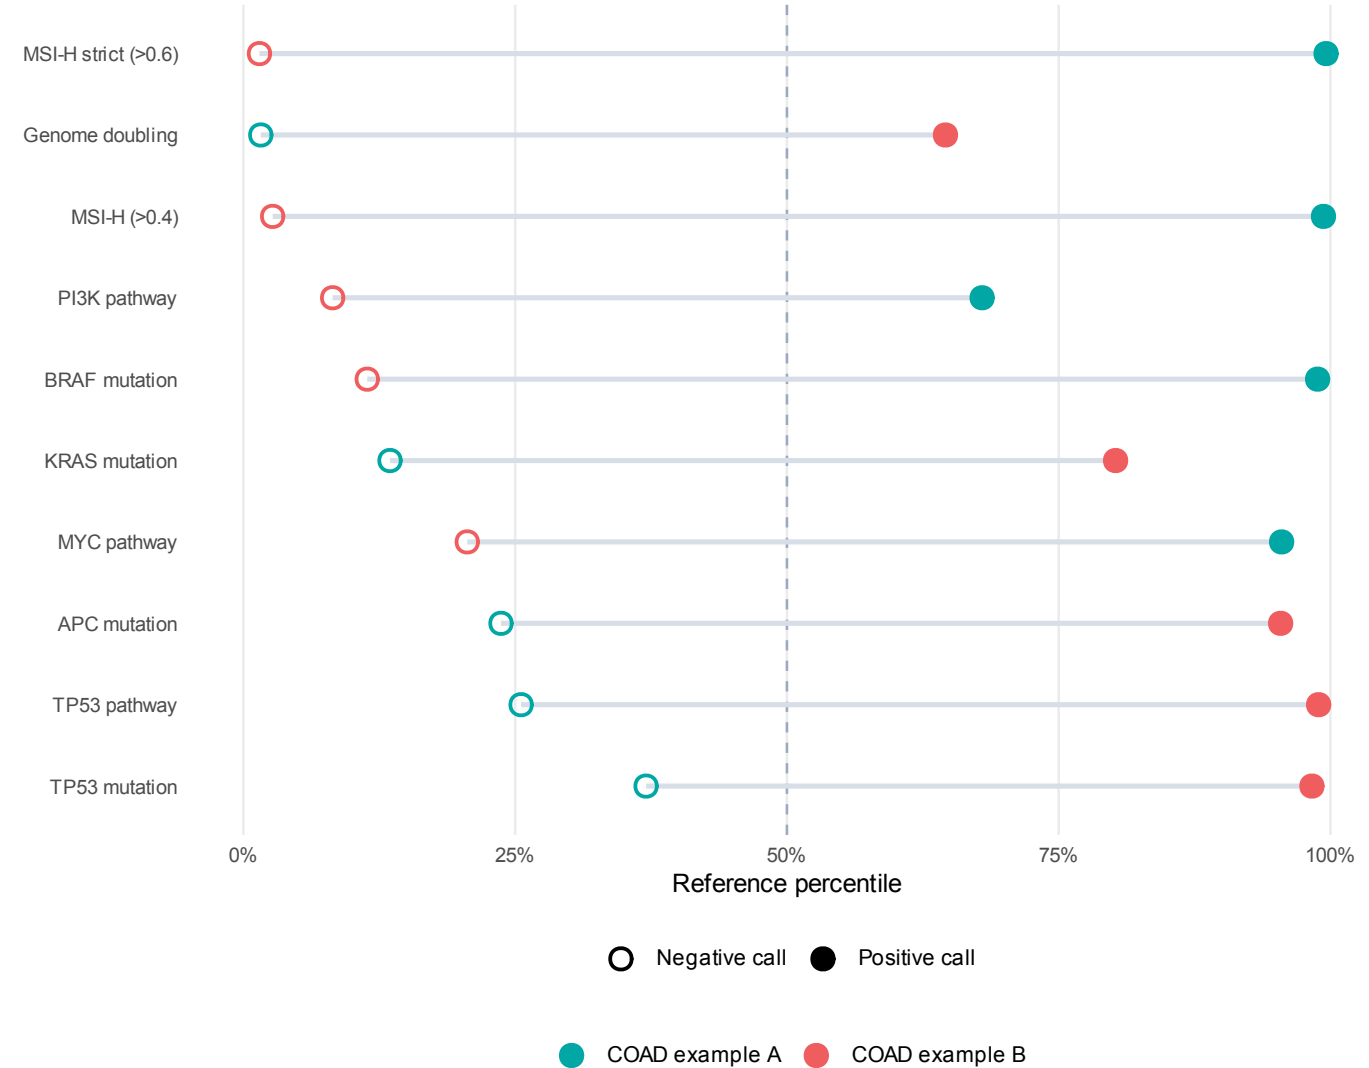

A Contrasting continuous profiles

Percentile relative to repeated TCGA out-of-fold predictions

B Binary calls separate the same examples

LDA-score percentile; filled points are positive calls, not probabilities

Example A: MSI-, mutation-rate- and immune-high / aneuploidy-low. Example B: aneuploidy-high / MSI- and immune-low. Binary scores are uncalibrated.
