

PathoFMPred profiles for two COAD patients across three slide representations

Columns compare patients; rows compare representations. Each panel shows only endpoints predictable for that representation. Radius is the internal TCGA reference percentile; corner values are original predictions.

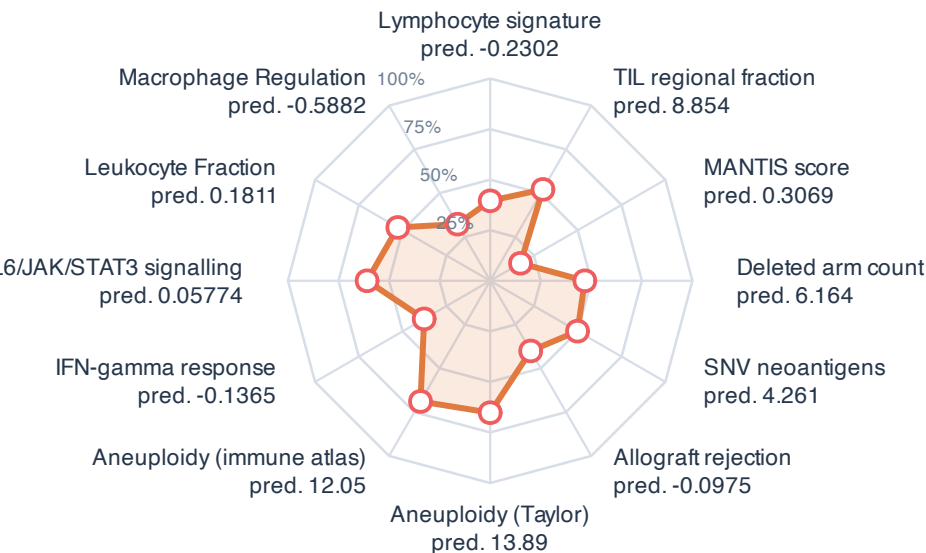

Patient A | TITAN (15 endpoints)

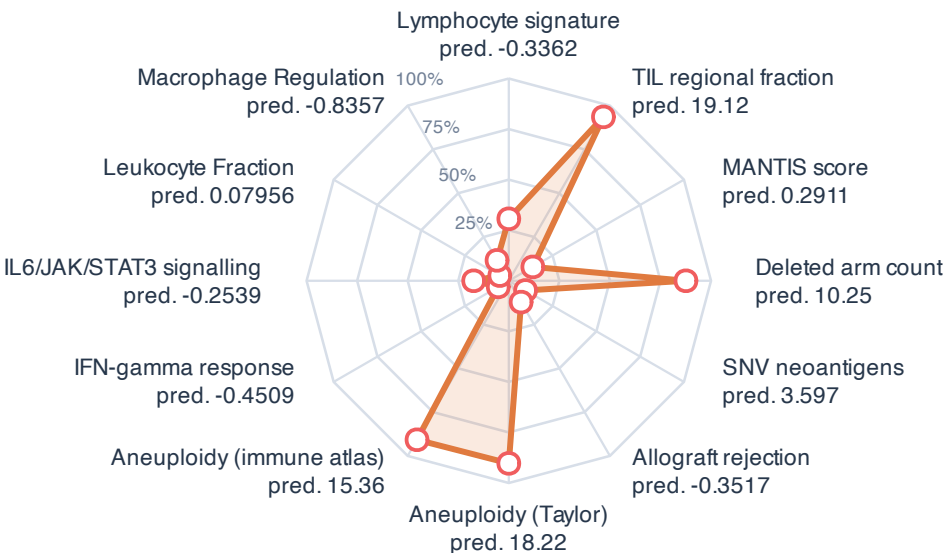

Patient B | TITAN (15 endpoints)

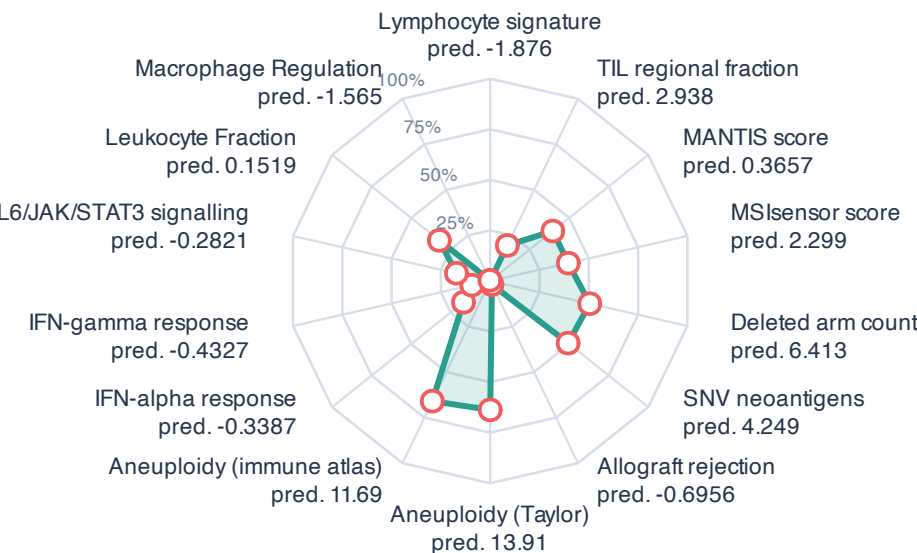

Patient A | Giga-SSL (12 endpoints)

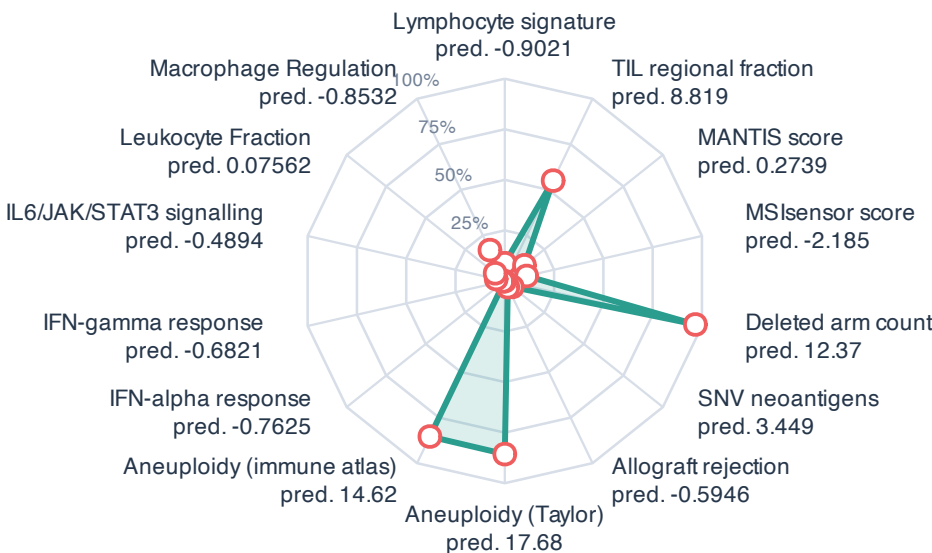

Patient B | Giga-SSL (12 endpoints)

Patient A | Prov-GigaPath (14 endpoints)

Patient B | Prov-GigaPath (14 endpoints)

Panels can contain different endpoints. Compare shared axes directly. Patient A is TCGA-AA-A01F; Patient B is TCGA-A6-A56B. Reference percentiles are not probabilities or clinical reference intervals.
