

TITANPred research-software visualization: internally derived COAD estimates

Post hoc COAD cases selected after limiting profile saturation and maximising profile separation; the comparison is illustrative, not validation evidence.

A Continuous estimates compared on one common reference-rank scale

Right column gives original predictions (A | B); reference rank is not probability

B Binary calls for the two illustrative cases

Score rank (not probability); [SITE-SENSITIVE] models fell below their original TSS-grouped threshold
